How you currently import feedback is time consuming and error prone. We improved the approach for importing feedback, making it much faster to import and incorporate feedback. AutoCAD 2023 will automatically import any feedback associated with a drawing, without requiring a step-by-step process to import each individual comment. Comments associated with the drawing (for example, in Word or Excel files) are automatically recognized and imported. Comments that are outside of the drawing are recognized and imported as separate comments. You can import comments for each layer and comment type. The comments imported are associated with the layer or comment type. If you save the drawing, you can also incorporate the changes back into the original drawing. When importing comments, it's important to understand the changes associated with the comments. AutoCAD 2023 uses the Inverse feature to preserve the original style of the drawing. You can also choose not to preserve the original style, in which case the comment will appear alongside any changes made to the drawing. Comments imported in this way are associated with the Comment Layer selected. You can also choose to import charts and images, which are associated with the Charts and Images option, respectively. You can create feedback in any number of layers and comment types. All comments imported to a drawing are associated with the layer or comment type, which means that you can import any comments associated with a drawing. When importing comments, it's important to understand the changes associated with the comments. AutoCAD 2023 uses the Inverse feature to preserve the original style of the drawing. You can also choose not to preserve the original style, in which case the comment will appear alongside any changes made to the drawing. You can edit comments before importing them. You can also use the "Replace all" option to replace existing comments with new comments, which are associated with the layer and comment type you select.
