dragontamer Hey
MarcScott, thanks for
sharing. Its cool that you
can run old DOS games on
a modern machine. I'm
wondering if its possible to
use HyperCard (or some
other Apple product) and
PC Drives (to save the
game on the PC) and then
load that up on the Mac?
Would that work? Or do

HyperCard applications need to use the entire system? ~~~ Goopplesoft Wow, interesting idea... I doubt the answer to your question is no but then this is a community like anything else :) ------ pmontra I did that with a bootable floppy disk containing DOS 6.22 that came with a CAD application. I had a 20MB

diskette drive and the space wasn't enough so I had to live with the limitation of having to copy a single file to it. I tried to skip that step with my current diskette drive and I ended up in a loop. After some trial and error I managed to get the bootable floppy working. It is annoying. I was using the drive all day (for some demos). The first problem

you encounter is a "not a supported diskette media" error. You get the maximum of 4MB of disk. I had to unpack the single file and I stored that in an unallocated area in case I need more space. That's the easiest way I can tell you now. The second problem is a BSOD: "A first chance exception of type 'System.NullReferenceException'

occurred in mscorlib.dll First chance exception at (xxxxx, xxxx)" After that you get the "DOS internal error" dialog asking to fix the error first. I managed to get past those two problems. Once in DOS and after the warning you get (non-
