of the H⁺ and D⁺ ion. We compute the ionization rates of the 1s, 2p, and 3d states of H⁺ and D⁺ by solving the time-dependent Schrödinger equation using the time-dependent Hartree-Fock theory. The cross sections for electrons emitted with energies up to 1.6 keV in the direction parallel to the molecular axis are reported and compared with the results of other calculations. The 1s ionization cross

section of the D⁺ ion agrees with the available experimental data whereas the 1s ionization cross section of the H⁺ ion deviates substantially from the available experimental data. This is due to an inaccurate asymptotic wave function at large internuclear distance.

The theoretical results for the 1s ionization cross sections of the H⁺ and D⁺ ions are in good agreement with the recent experimental results by Kukushkin and coworkers. John Garfield's "The Devil and Daniel Webster" (1941) stars Gary Cooper as the titular figure.

Legendary actor John Garfield died on Nov. 26 at the age of 91. The Spanish Civil War veteran, who gained Hollywood fame for his dark-haired, steely-eyed performances in "The Hunchback of Notre Dame" and "Gentleman's Agreement," passed away at a Santa Monica hospital. In October, he suffered a stroke, which left him confined to a wheelchair. He was hospitalized in the next month and spent his final days in hospice care, according to his friend and agent Harold Clurman. "He went peacefully," Clurman told the Hollywood Reporter.

Timeline The timeline controls the creation of a drawing in progress. It shows the status of each work station, the time remaining until completion, and the stage that the work is currently in. The timeline is used when designing a complex assembly and the stages allow the user to see the drawing progress for each component. A typical timeline is represented as a series of squares and rectangles. Each square or rectangle represents a stage, the number and color of the square or rectangle indicates the current stage, and the area is proportional to the amount of work remaining in the current stage. When a stage is complete, it is represented by a completed square, and the total amount of time spent on that stage (in hours, minutes, or seconds) is indicated by the area of the square. If work stops at that stage, the square turns orange to indicate that the remaining amount of time is unknown or that the stage was stopped. When a stage is still incomplete, it is represented by an unfinished square, and the amount of time remaining until completion is indicated by the area of the square. If a completed stage remains unfinished, the area of the square is white and the square turns orange. If no work has been done, the timeline uses the hatch pattern to indicate that. Also, if a workstation is stopped, it is represented as a rectangle, instead of a square. If there are no more stages, the timeline uses hatch patterns to represent days, weeks, months, or years. If there is a specific task that has been assigned, it is represented by a dot. **Timeline Designer** The Timeline Designer is a graphical tool that assists a drafter in creating the various types of timelines. It is used to modify timelines in AutoCAD, and is now a part of the Timeline subapplication in 2019. The Timeline Designer was introduced in the last major release of AutoCAD R13 in June 2013. It is a separate application available in the Windows (x86 or x64) and macOS (64-bit) versions of the application. In the AutoCAD timeline designer, three timeline subapplication windows are used: the timeline, the work area, and the output window. The timeline subapplication displays the timeline itself, the work area shows the project on which the timeline is created, and the output window is used to preview the timeline. The timeline is a static element of the timeline designer that allows one to place constraints on the timeline that a1d647c40b
