Q: Semantics for property destructuring in a loop I am wondering about the formal semantics of destructuring in a loop, like the one below. The semantics for the "in" property is clear to me: The list is iterated over and for each element the property is destructured. Now, I don't know whether the "let" keyword inside the loop is executed in a strict or a function call way. { [, index] in for (let {i,...rest} = {i,...arr}; i > 0; i--) { // access rest[index] and rest[index + 1] } } I would assume that the "let" keyword is executed in a function call way. Otherwise, I do not understand the let-keyword, because I could just write something like that in an arrow function, or I could write let ({i,...rest}) = {i,...arr}. A: This is not a function call way, its a lexical binding way let {i,...rest} = {i,...arr}

These are my first pair of simple striped t-shirts from Old Navy and it was a no-brainer to grab it out of the closet. So, with a weekend in-progress, I decided to play a little dress up and rock this top with denim and some loafers. The gray color really worked with the deep burgundy leggings I was wearing. (I wore the shoes that I bought at Target on Friday when I was at the mall.)Q: What is the recommended way to create XML document in Scala? A colleague of mine wants to migrate his project to Scala. This project uses a lot of Java libraries that export to XML documents, so he asked me if there is a way to do the same using Scala. I looked at the examples of XML parsers such as XML.scala. I couldn't find any examples on how to create an XML document using this library. Am I missing something? Is there a recommended way of creating an XML document using Scala? A: If you like the XML.scala library you can try to use the library directly with the JAXB annotations. XML source: package xml; import javax.xml.bind.annotation.XmlAccessType; import javax.xml.bind.annotation.XmlAccessorType; import javax.xml.bind.annotation.XmlElement; import javax.xml.bind.annotation.XmlRootElement; import javax.xml.bind.annotation.XmlValue; @XmlAccessorType(XmlAccessType.FIELD) @XmlRoot
