Hacking The Juniper Networks MIO Juniper's network devices are among the most complex pieces of equipment you can find in your home. They can be called on for support, sometimes in the middle of the night. The company prides itself on its knowledge and experience in the networking field, and it's no easy feat to be able to diagnose a problem with one of their devices. This knowledge is what helps, so Juniper has produced an iOS application, dubbed the Juniper Manual for iOS, to help provide some quick information on the most commonly used Juniper models. The application is one of the better iOS apps we've seen that is geared towards the network engineer. For instance, it provides a network view with options to change the subnet, enable NetFlow, and change the IP address for the device. It has a hierarchical table that organizes information into three different sections: the top level offers a quick status of the device; the next section offers information about the OS version on the device and allows you to change the boot, root, and kernel parameters; and the third level gives you information on the hardware, drivers, and MAC address. The application is free for those willing to use it. 2. iOS 5 Fixes iOS 5 may not be out of beta yet, but the good news is that it's still an excellent mobile operating system for those interested in security. The best part of iOS 5 is the added capability of remote lockscreen login, which is considered a major security improvement. In addition, mobile keyloggers in iOS 5 are now an obvious target, as they can be easily detected. iOS 5 also has numerous new App Store management features, as well as an improved location-based Wi-Fi hotspot toggle. 3. Will Your Dumbphone Be Cheap? One of the major determinants of the price of your phone is its application of the Rosetta technology. When deploying Rosetta in phones, the software developer has to make all of its assets compatible with the processor. When deploying them with a phone, the developer builds devices that have fairly similar set hardware capabilities. Devices equipped with the 1GHz Cortex-A8 processor may be able to perform well on the same Rosetta-enabled Android handset because both have the same
