Immediately after and before the maneuver, which is to be performed this coming weekend,

NASA will publicize the arrangement of Earth and Saturn in space, including the fact that Cassini -- which means "in the great sea," in Greek mythology -- was sent to Saturn by that sea. But will the experiments needed to explore particle physics - the theories of the next-generation scientists - also help uncover a riddle of how the universe began? In his just-published book, the physicist Gerardus 't Hooft uses the prologue and epilogue of "The Large Hadron Collider" to explore the nature of time, its essential role in a physical universe, and the implications of colliding particles. Co-written with Nobel Laureate Martinus Veltman, "The Large Hadron Collider" looks at the behavior of quarks, and the electromagnetic forces which can be harnessed by scientists working at its three experimental stations in Geneva, Switzerland, and is the only book on astrophysics with the word "particle" in the title.
