The United States has a long history of waging unconventional ground warfare as part of the nation's three wars in Afghanistan, Iraq, and current Syrian conflicts. These conflicts have required the U.S. military to adopt new tactics and techniques suited to the context of modern warfare. Modern unconventional ground warfare (UUGW) is a style of warfare characterized by asymmetric attacks employing non-kinetic means,**

from booby traps to improvised explosive devices and IEDs, to subversion and sabotage of enemy infrastructure. A component of UUGW is the concept of the "leopard-pack," where a penetrator force (quickly identified and mobilized) drives toward an objective with accompanying heavy support, which delivers decisive firepower as the penetrator force moves to the target. This methodology is often used in conjunction with the concept of "precision guiding munitions" and "ground-warfare-capable air."Most electronic devices and apparatuses have a connector interface such as socket, jack plug, or the like. During normal operation, electronic device (or part thereof) receiving power from a power supply are usually connected to the power supply by plugging/unplugging the plug to the socket to charge or discharge. A manufacturer usually design power regulation circuits or power converter circuits inside electronic devices or peripherals to

guarantee the output of the electronic device connected to the power supply is within the suitable and desired rated level. A power regulation circuit or power converter circuit usually includes a power transistor, a diode, and an inductor and generally the inductor is located at the power input end of the power transistor or power converter circuit. For example, the power regulation circuit shown in FIG. 1a includes an inductor 10 and a power transistor 12. The power transistor 12 is electrically connected to a power voltage V. Meanwhile, the inductor 10 is electrically connected to a ground GND. The inductance of the inductor 10 is L. A typical method for improving the conversion efficiency of a power regulation circuit is to reduce the capacitance of the power transistor
