Although it contains a lot of tools and options, the overall workflow for creating images in Photoshop is quite simple. There is a way to learn how to work in Photoshop, and it is a matter of learning the process and using a simple approach to your workflow. This is not a difficult program to learn, even for beginners. Getting Started The first step in preparing your image for Photoshop is to either scan or photograph your subject. If you plan to do serious work using Photoshop, I recommend you have your first image scanned into Photoshop as a high-resolution TIFF or PSD file, so it can be manipulated without the file becoming too large or unwieldy. You will need to adjust the colors and contrast to fit with the intended output,

so that you have a realistic preview of what the final image will look like. Then you will choose a template to use for your Photoshop file (see *Creating a Template*). Then you need to place your images and other content on the document. ****Figure 1.1**** : Getting started in Photoshop After the images are created, you will need to calibrate the colors in the image. There are several ways to calibrate an image. You can calibrate manually or automatically. For illustration purposes, in this book, we will use the photo calibration tool in Photoshop. This is also called the Lens Correction tool. However, we will cover it at length in Chapter 2. As you create your image, you will use different layers to save space and track the editing of different aspects of your image. As an example, Figure 1.2 shows layers where I

have placed my images, an adjustment layer to brighten the image, a layer for black and white, and a layer for the background.

image Before you go into Photoshop, you need to set your monitor up to see what you will be working on. Chapter 2 explains how to set up your monitor. Also, even though your monitor is set up, you should have the programs you will be using open

There are many services where the concept of reality is an important part. In the case of online stores, the concept of reality becomes more and more important. Now you can order a product or share a product on any social platform in less than few seconds or minutes, without having to touch the product itself. This is the advantage of B2B e-commerce websites. The user interface must be intuitive enough for customers to immediately understand that everything is real and you have what they need. This is what we have discovered the last year through our combined experience with e-commerce websites for a large number of

clients, not only at Organigram. E-commerce sales systems must also be able to implement dynamic business rules, according to the situation that the seller's business is undergoing at any given moment. Given the nature of the business, there is often a certain amount of flexibility in the rules. One example would be the number of days a seller will be allowed to receive products. Another example would be the number of packages required. There are cases of discounts, so the number of packages is reduced or the discount is adapted based on the quantity of packages. Given the difficulty of changing an existing system, we have decided to test our two most powerful e-commerce platforms to search for solutions to this problem. To keep the test as short as possible, we have only tested the Amazon and Shopify platforms,

both to check the direction that they have taken and the possibility of modifying the system. The test lasted 3 months. The objective was to test the systems' dynamic interface, including the possibility of adding, modifying or deleting business rules. But beyond this, we also wanted to test the functionality of the systems and their overall performance. Results of the test The systems offer a wide range of functionalities. Each one has multiple tools that facilitate the management and the use of the platform. But the test demonstrates that they have their limits as well. The Amazon platform The platform has many tools available to the user, but only one of them is used for all the uses. These tools and functions are not organized or systematic enough. The Amazon platform offers some functions that are useful for

marketing campaigns, such as the ability to quickly generate a Facebook ad or to send an email reminder to previous orders. The Amazon
