The Macintosh version of Photoshop is the older of the two software versions, and for many years, Photoshop was simply a better program for the Macintosh. As of this writing, the Macintosh version is on version 10.0 and the Windows version on version 13. The Mac version has a lot of features missing from the Windows version, including Retouch, Shadows & Highlights, and Frame Adjustment Tools. For some people, this is no big deal, but others may find it frustrating. The Mac and Windows versions are available from the Adobe website for \$79 and \$129, respectively. Photoshop has undergone some significant changes over the years, but the Adobe System Interface (ASI) is the basic user interface (see Figure 4-1). Both the Mac and the Windows version support a number of additional interface styles: Classic for the older-generation Macs. Motif for the Macintosh family computers made after 1998. CS (Professional Photoshop) for Windows. CS3 (Professional Photoshop) for Windows. CS4 (Professional Photoshop) for Windows. Photoshop CS4 and CS5 are Creative Suite programs: a collection of software programs that, when purchased together, comes with a number of useful applications. **Figure 4-1:** The ASI is the basis of all Photoshop interfaces. Photoshop Elements is much cheaper, costing between \$40 and \$60. It isn't a complete Photoshop program and lacks many advanced features, but it's a great application for editing images from a digital camera and household family snapshots. Creating a document Before you start using a program, you must start with a file. You can save all of your images into a folder on the desktop or into a folder on a shared drive or folder or even a flash drive. It's easy to create a folder and add subfolders to accommodate various projects, such as family portraits, special occasions, or photography sessions. You can also simply use the desktop as a folder for your projects. To begin editing, you must open the program. Refer to Figure 4-1. The interface consists of a number of tabs, as follows: The menu bar includes the following tabs: • Image: Contains the images that you plan to work with. This tab also includes the File menu and the Image menu. • Edit: Here, you find the menu items for using Photoshop's tools, commands, and options. •

Adobe Photoshop Elements is free to download and use, and does not require any payment or subscription to access the full features. This guide will explain how to use the Photoshop Elements free version. What is Photoshop Elements? Photoshop Elements is a bit like a cheaper version of Photoshop. It is meant to help people who do not require all the features of Photoshop, but only need a basic feature set. The third-party applications that are also compatible with Photoshop Elements are already included in the software by default, such as Pixlr or GIMP. This makes it easy to edit images and color them. For the most part, Photoshop Elements is like a low-end version of Photoshop. It shares all the features of the professional version. The most important drawback is that the user interface is much simpler, with much fewer features, and the overall user experience is not up to the standards of Photoshop. However, there are many people who just use Photoshop Elements for basic editing. With this guide, you will learn how to get the best possible editing experience from Photoshop Elements. You will also learn how to install

Q: Speeding up CSV loading I am using the following code to load a CSV into a PostgreSQL table: import pyarsing as pp import csv import psycopg2 csvFile = open("F:/TestFolder/Sample.csv") rows = [] for row in csv.DictReader(csvFile): rows.append(row) csvFile.close() cur = sqlContext.createDataFrame(rows) cur.show() sqlContext.read.csv(cur, csvFile, sep='|', quoting=csv.QUOTE_MINIMAL) The sample.csv is a CSV file that is 250 MB in size. I load the data into the data frame and then save it as a.gz file so that I can store it in HDFS. However, on a 4 core machine it takes about 2 hours to load the data. What can I do to speed up loading the data? A: As you already know that opening files is the slowest operation and that's what is taking so much time. Also, sometimes, opening files takes many times the physical reading time of the data. The first thing you could do, is to open the file once, and keep it opened. Then, each time you do something in the data, close it and re-open it. This will speed up the operation considerably. If you do not care about saving the file, use the following code instead: import psycopg2 import gzip import csv import time import os fileName = 'F:/TestFolder/Sample.csv' gzipFile = os.path.join('F:/TestFolder', 'Sample.csv.gz') with gzip.open(gzipFile, 'rb') as csvFile: with psycopg2.connect(database='databaseName', user='dbuser', password='pw', port=22) as connection: cursor = connection.cursor() cursor.execute('SELECT 1') with open(fileName, 'rb') as csvFile: rows = c
