## Download Mcrypt Php Windows Install REPACK

### [Download](#)

after the installation, the mysql database is configured with a strong, random password, and the newly-created root user is connected to it. the user's password is stored in the database, so you won't have to enter this password on every server start. the rest of the installation is straightforward. `$.id:.gitattributes` download mcrypt php windows install this indicates that the files in this folder should be ignored when you work with git. the composer install process will copy all of the files from `/vendor` to `/vendor/bin`, and it will use those files to install the dependencies it needs. as a result, you don't need to be concerned about git when you're installing the dependencies. however, if you're installing the dependencies manually, you should be aware of the differences between git and standard file system operations.

## Download Mcrypt Php Windows Install

now comes the test part. we are not going to install our software on the server yet. instead we are going to run this command again and check if we now see our package installed. composer install output:  
installing laravel/laravel (v5.3.3) - installing laravel/laravel (v5.3)  
note: updating dependencies via composer.phar is disabled because your "download-cache-dir" value was not specified in your composer.json file. see <https://getcomposer.org/doc/05-repositories>.

---

md#download-cache-dir for more details. download mcrypt php windows install the output clearly says that the package was installed. you can now proceed with the installation of the other software that depends on mcrypt. the installation of php is fairly simple. you need to download and install php5-cli, php5-common, and php5-curl. if you are running this on a 64-bit system, then you can also download php5-xdebug. you can find these package names and the download links in the link above. currently, all of the ubuntu packages will install in /usr/local. this is exactly the folder where your laravel installation will be installed. we are going to install it there, as we do not want to interfere with the existing install. these steps also create a symbolic link from /home/user/.composer/vendor/bin to /usr/local/bin/composer. finally, we are going to edit the /etc/php5/apache2/php.ini file. modify the line to tell it to use the /usr/local/bin/php composer script instead of the global php binary. after that edit, we are going to give the server a reboot. 5ec8ef588b
