microsoft office 365 proplus is the online version of office 2016 that you use to create and edit documents, presentations, and other documents. office 365 proplus is available for people who have an office 365 subscription, or who prefer the convenience of the office 365 cloud. office 365 proplus users can access their office apps from any device, whenever they want, regardless of their location. because office 365 proplus is a subscription service, office 365 proplus users can use their subscription to create and edit documents, presentations, and other projects. however, because office 365 proplus is a web-based subscription service, it requires an internet connection to work. if you already have office 2016 installed on your pc, then you can use office 365 proplus and its free trial to try out the online versions of office without buying a subscription. one of the basic concepts of office 365 is that you can use office 365 on any device with an internet connection. this is why you can use office 365 on a mobile device, a pc, or a mac. however, office 365 is not the only office subscription that gives you access to office apps. if you are already a subscriber to office 365, then you can use office 365 and its free trial to try out the online versions of office without buying a subscription. if youre coming from office 2013, office 2016 will be a mixed bag. the apps have some good new features, and their ability to create and share documents online is a definite improvement. the apps have also been streamlined so you dont have to learn a bunch of new shortcuts and features to get things done. but the apps also suffer from the same issues that has plagued them since word 2010, and theyre still just not as good as their windows rivals. if youre a heavy office user on a desktop machine, then office 2016 isnt going to hurt your workflow at all. if youre coming from a smartphone or tablet and want to create content on the go, then youre going to want to check out something like sway instead.

overall, the office 2016 desktop apps dont really present many compelling additions by themselves. most of the changes are minor compared to what we got in office 2013 three years ago. microsoft hasnt attempted to combine touch, typing, and inking into a single app this time around. instead, there are separate windows 10 mobile apps that are designed for tablets and phones. it seems a bit crazy to have two versions of the same app, but its largely because these desktop apps are already powerful and it will take some time to transition all of those features into the touch-friendly versions. but the biggest addition in word is real-time co-authoring. for the first time in a desktop version of word, you can now see what others are typing in real time when multiple people are editing a document stored on one of microsofts cloud services. all of these features that make office more convenient to use are still there, but there are also some big changes with word, excel, and powerpoint. microsoft has moved to a new file format called openxml that uses a single xml file for your documents instead of its old pdf format. this makes it easier for office to understand the document, so it can find and make changes as needed. this also makes it easier for people who use office to move to office 365, since their files are easily convertible. for office users, the advantage here is that the file format is now more universal, so that means the documents can be used by many more apps and programs. for example, if someone sends you a word document in 2016, they wont have to worry about compatibility with older versions of office. you can edit it in excel, even if you dont have office 2016 installed. it also means you can open it up in an office 365 document management app like onedrive, box, or sharepoint. its a similar story with excel and powerpoint documents. you can still open up excel files from office 2007, and the new versions of office continue to understand the older file formats. 5ec8ef588b
