The term "Zero Day" refers to a bug, flaw, or vulnerability that hasn't been previously known about, and as such, the solution is not known yet. Finding zero-day exploits is particularly challenging because they are often difficult to trace and use or sell, and although they don't have to be brand new, they cannot be used for attacks on systems and networks that were previously unaffected by them. Zero days, however, are more than just a word - they are extremely valuable for people who can disclose them responsibly. The term "Poison Pill" is a metaphoric term referring to a patch, or code used to protect against a vulnerability or exploit. Just as a poison pill softens the impact of a few nuts and bolts, so a poison pill distributes the impact of exploits and vulnerabilities more evenly. Poison pills are relatively easy to implement, and once distributed, become part of the system's architecture. Secunia Research is the world's largest provider of vulnerability intelligence, with the largest database of public and commercial security vulnerabilities. Our vulnerability research team has discovered thousands of security vulnerabilities in hundreds of products from over 200 vendors, which we have provided to customers for free to help them protect their customers. The vulnerability can be exploited by a web page with a malicious JS file. The JS file contains a legitimate link to Secunia's advisory . We recommend that organizations confirm that their readers are updated to the latest version of their browsers.

Secunia researchers discover hard-to-find vulnerabilities that aren't normally identified with techniques such as fuzzing, and the results have been impressive. Members of the Secunia Research team have discovered critical vulnerabilities in products from vendors including Microsoft, Symantec, IBM, Adobe, RealNetworks, Trend Micro, HP, Blue Coat, Samba, CA, Mozilla and Apple. Reconnaissance of this vulnerability was carried out by Secunia researchers. It was found that the vulnerability resides in the email component of the Evolve Office update service. Evolve Office is a Microsoft Office program for updating documents without using the web interface. It is used in conjunction with Windows Update to download document updates in systems without internet connectivity. To further test this vulnerability researchers downloaded samples of files attached to the update service and found that it would be possible to download a malicious document that is able to be opened by the target. This document can contain a wide variety of exploits, including vulnerabilities that are not normally identified by the traditional exploitation methods such as fuzzing. An example of such a malicious document is the attached example. The first (and most likely the only) stage of an attack is the receipt of the document by the victim. A remote and local attack is possible. In a remote attack the payload is uploaded to a command and control server and in a local attack it is downloaded from a third party. Upon receipt of the document a victim will be notified that a document update is available and an update request will be sent to the victim. This is designed to act as a bypass to the Anti-Virus and Anti-Exploit process and is an attempt to bypass many of the real-time web based defences. The document will try to open an active internet connection to a remote site in order to download a VBS. The payload is extracted and then executed. MS08-067 is a remote vulnerability and MS08-065 is a local vulnerability. 5ec8ef588b
