It's been almost 5 years now since the last major update to Adobe Photoshop. Elements is well-known for its many updates and new features. In this latest release, it includes 200+ new features, enhancements and bug fixes. Some will take you a long time to figure out while others are easier. If you are a photographer, you will enjoy it's adjustments and enhancements for RAW images. Some improvements enhance the quality, color and focus among other things. For the first time Elements includes the ability to select and work with RAW images in Camera Raw. This is a big advantage with the RAW format. It enables photographers to convert unmanipulated RAW images into an editable format without the Lightroom filter. I'm familiar with a lot of the other new features. If you are a beginner Elements user, try the presets and crop the photo first to get a feel for the program before trying to get the hang of all the new features. The other new feature is the Camera Roll which is located in the side panel. This automatically creates folders for the images you take with the camera. You can add more by dragging images into it. The folder icons have rotation markers added, so even those with a lot of images are easy to find. Add the keyword tags for images, if you want to. It's also fully customizable with auto-tags. There is a fairly large amount of features to explore and experiment with. The tool bar now contains the new Adjustment Layers feature. This enables the user to create adjustment layers. This is a useful feature if you want to make changes to an image without accidentally changing an entire layer throughout the entire image.
