Lightroom, on the other hand, is just reaching its mid-twenties, as are Creative Cloud and Adobe XD. This is a product that is growing into maturity. This is why many people choose Lightroom for RAW conversion. It has just reached a point where it is fully capable of doing some very deep image tinkering. It can repair artifacts, even very complex ones. It can automatically push and pull adjustments back and forth across multiple images, and send them back and forth between Lightroom and Photoshop CC. It will even create collections. For the time being, however, the best way to combine assets is to export the image to Lightroom, do your work and then export the image from Lightroom to Photoshop CC. There is no way to combine assets in the same process. How does it work? **ABOVE:** The Layer Mask tool allows you to show or hide an object in a layer. **BELOW:** A hand drawing and a replacement background Photoshop. The model is from the same stock library as the iPhone. Bonus: you can add an illusion of Depth using a Photoshop layer above the Lightroom image. Adobe's Mobile SDK makes this possible and more. This is a feature that I already feel excluded from my own collections of images because the process is so tedious, but it looks like it could be a lot of fun. For example, I draw a bunny, hand-paint a background and then replace it with a stock photo of a rabbit. Photoshop's entire color palette is available to me to choose colors for my new eyes. It even works well with the Photoshop Pen. Having said that, my guess is that this process will become easier in time with the Mobile SDK. I remember using a version of Photoshop CC for iPad, and there was the ability to drag and drop layers. However, I do not know if that was the version from Adobe's own SDK.
