At its annual Max conference in September, Adobe demonstrated a tiny printing inkjet head of 12-micron nozzles, and said it may end up in a printer by 2021. In its desktop version for Windows and Mac users, Adobe's Student Suite offers a wide range of tools for many areas of photo editing and design. Among them, the Adjustment Panel was huge and sees the most improvement in this release, with an entirely new interface and new tools to help make major changes quickly. The high-end mobile market has moved way beyond tablets and smartphones to other devices like ergonomic laptops and even tablets. When you consider all the apps now available to streamline an image editing workflow, it would be hard to beat a computer with Adobe's Photoshop. The Notebook serves that goal well, but it costs a pretty penny too: The RM 8,199 model (with Core i7 processor, 64GB SSD, and 16GB RAM) is not cheap. But you can get a much better deal, as I did when I bought an iPad Pro 10.5 for US\$518 three weeks ago. It should be no secret of course that Adobe's Photoshop is the standard for professional image processing and editing tools. And if you use the software on a regular basis (or in a couple of months, as I will be doing), there is a good chance you will appreciate some of the additions and improvements. Photo Matching is certainly one of those, as it should be, given the camera sensors available on the market today. The Photomerge tool has a new feature called Auto Weave, which is truly a game-changer for those needing some magic in their time-consuming photomerge endeavors. The Retouch module has the added benefit of faces and objects placed in Live Preview, which I am looking forward to using on a daily basis. The Smart Brush area also gets some more useful tools with the introduction of Layer Mask. Some of the obvious things, such as the new Spot Removal and Eraser editing tools, are also pretty cool. However, I have a few concerns when it comes to the software. Firstly, Photoshop CC is a resource hog even on powerful computers. As I already mentioned, importing images from Lightroom can be extremely slow most of the time. I don't think that it is the import process itself that takes so long, but me not being the greatest computer savvy person, plus the fact that I am using a number of libraries that I keep moving around, leading to more disk activity and increasing file and process loads and write operations. Not to mention the additional process of possibly uploading new photos to Photoshop and having them selected and edited elsewhere. In other words, all of these things (settings, library

locations, photos, etc.) make Photoshop more resource hungry than it should be. I believe that the software could be optimized to be more streamlined, but that's not enough in the end. Moreover, Photoshop CC has a pretty complex workflow (and is much easier to use than any other RAW converters I have tried so far). Even so, the interface is robust enough to handle any workflow without causing problems. Moreover, Adobe has officially recognized Lightroom as being "better" at image workflows and adhering to what Adobe is like to call the "Adobe Managed Workflow Management". I cannot agree with that, since Lightroom's presets and libraries are simply the result of a lot of user modifications and should not be viewed as a standard. Of course, it would be a time-consuming task to properly develop the standard, so perhaps we can live with it in a way. Lightroom is a bit better with vectors though, since they handle shapes correctly (but only when applied on the the Layers panel). Up to this point, I have not seen any issues with vector creation, which is an important issue for me. Nevertheless, I did find that some of the older workflows through the software can be a bit cumbersome and more so than in other solutions. This often leads to images being "perfect", since in today's world, we are all guilty of this rather heinous crime and we shouldn't be, nor should we let the software, which is supposed to save us from ourselves, do that job for us. On the other hand, Photoshop is still the system I am familiar with and the most comfortable with overall. It just works for me. Overall, I am satisfied with the performance of the software and will continue using it and I will recommend it to all my friends. One of the most important things I value in software is the quality of the algorithms that it supports. This is often the most importantly, as how often do we have to use them in our daily work? However, that is not a flaw per se.

Once you've selected the object or area you want to alter, if you're using the correct tools you'll see that your initial brush stroke affect that area only. You can continue to paint out of that image or select another area to modify. Once you've made your first brush stroke you can continue to add additional strokes. You create a new layer. The object that you selected is behind the layer, and all that the layer contains is the color of the object. When you create a new layer, it appears as a translucent area on top of the object. Different new layers have different thicknesses and other settings. To change the thickness of the layer, the layer, or the selection you need to click on the layer — just below the word "layers" on the Layers panel — and then choose your new thickness. You can also change the blending mode and other other settings for each layer. When you are finished, all of your work will be a single object. You can take it a step further by using painting emulation tools. These tools isolate the object so that you can paint elsewhere. Once you're finished, you can view the results of your work by connecting the file to a holding or production medium, such as a camera or press. If your file is directly connected, you can see your imported image on the right window. If your import is indirect, you can see a preview of the image on the left. You'll find that working with images in Photoshop offers a more intuitive, and customisable, experience that can be highly rewarding. It's an easy and painless way to produce professional results. Like most of the software we use, you don't get much out of it until you've put the time in. And, like most of it, once you're in the zone, it becomes second nature. e3d0a04c9c
